To: Sir Mark Rowley, Commissioner of the Metropolitan Police Service

Dear Commissioner,

We are writing as a coalition of groups who campaign on ending violence against women, racial justice issues and digital and human rights to express our grave concern over reports that Metropolitan Police Service ('MPS') staff members have been accessing an online, private facial recognition search engine. A report from Liberty Investigates in *i News* has revealed that MPS computers accessed the website of PimEyes, a vast facial recognition search engine, 2,337 times in just 90 days.¹ This represent a serious failure of oversight, and is likely to be unlawful under human rights and data protection law.

It is reasonable to assume that of these 2,337 hits, some, if not all of these will be MPS staff members using PimEyes' technology to identify members of the public. We find the MPS' suggestion to *i News* that staff have not used this website to perform facial recognition searches unconvincing, particularly given the MPS' previous use of Clearview AI,² and your continued investment in facial recognition surveillance technology as a policing tool.³

The MPS did not publicly disclose that its officers were using PimEyes to identify individuals, and the force's policy documents make no mention of the use of private facial recognition databases. We understand that your force has now blocked access to PimEyes from devices, suggesting that the use of the technology lacked appropriate oversight.

The MPS already has access to its own, internal retrospective facial recognition software, based on custody images, with policies overseeing its use. However, the possibility that the force is circumventing these policies to use a private company's software is deeply alarming and warrants further investigation from your Office.

PimEyes allows users, in this case MPS officers, to find images of anyone from across the internet. This could include photos from media articles, personal blogs, dating websites, employment profiles, and other publicly available websites. The returned facial images are provided alongside the URLs where they are hosted, giving the user highly revealing contextual information about the searched individual. This could include the searched individual's name, details about their place of work, or indications of the area in which they live. PimEyes has been repeatedly linked to the stalking and harassment of women and has already been the subject of a legal complaint to the Information Commissioner's Office.⁴ Parliamentarians have also expressed their concern over its use in the UK.⁵

PimEyes enables privacy intrusion and stalking on a scale previously unimaginable. Police officers work with highly vulnerable people, and any misuse of biometric data must be investigated and steps taken to ensure it is not repeated. We have serious concerns that police officers could be

exploiting this technology to track victims, witnesses and suspects, absent of scrutiny and for their own purposes. The Casey Review found that the MPS is institutionally sexist and there have been a large number of harrowing recent instances where MPS officers have exploited their position to identify and abuse women.⁶ We are gravely concerned that officers may have used PimEyes on MPS devices to identify vulnerable women.

We have a series of questions relating to Liberty Investigates and *i News*'s investigation:

- Were senior officers aware that PimEyes was being used on MPS computers? Was this sanctioned or encouraged as part of investigations or intelligence gathering?
- What steps are being taken to uncover a) how long officers have been accessing PimEyes;
 b) what role technology played in police investigations; c) which officers made searches using PimEyes?
- Were any individuals charged with criminal offences following a PimEyes facial recognition search?

The revelation that MPS staff members have secretly been using deeply invasive facial recognition searches will further damage trust in the MPS during a period where rebuilding trust has been said to be a priority for policing. We welcome the decision to block access to PimEyes on MPS devices, but the public must be informed as to how this tool was used. We also urge you to refer this potential breach of data protection law to the Information Commissioner's Office for further investigation.

We look forward to your response.

Yours sincerely,
